

GLASS SLIDING WALL SOLUTION

Leading partitioning specialist, Style, has launched a new glass sliding wall solution for balconies and terraces (BSW). Transforming a balcony into functional space, glass panels are used to enclose the area, creating a barrier against weather and noise without impeding the view. On fine days, the upper section of the glass panels can be neatly folded and stacked to one side, allowing people to sit out and enjoy the sunshine. For terrace rooms that open straight out into a garden or external seating area, Style's new glass sliding wall allows the boundary between the two spaces to be easily removed on sunny days, whilst successfully combining weather protection with uninterrupted views of the outside during inclement weather. With a discrete guidance track that can be fitted flush to the floor, the BSW system creates a truly a streamlined aesthetic.

Making for a welcoming environment, even when a terrace room or balcony is entirely enclosed by the glass panels, air still circulates internally thanks to tiny, 3mm gaps between that provide continuous ventilation. Any condensation is quickly filtered outside thanks to unobtrusive drainage vents and guttering. Fitted with a sophisticated roller system, the individual glass panels also incorporate autonomous pivot point identifiers, ensuring smooth and effortless manoeuvrability every time.
